Dark Winter: How The Sun Is Causing A 30-Year Cold Spell

Synopsis

Climate change has been a perplexing problem for years. Casey's research into the Sun's activity, which began almost a decade ago, resulted in discovery of a solar cycle that is now reversing from its global warming phase to that of dangerous global cooling for the next 30 years or more. This new cold climate will dramatically impact the world's citizens. A sobering look at Earth's future, Dark Winter predicts worldwide, crop-destroying cold; food shortages and riots in the United States and abroad; significant global loss of life; and social, political, and economic upheaval.

Customer Reviews

Dark Winter is a breathe of fresh air in a world full of politically polluted books on the subject of climate change. All one has to do is look at a scale model of the solar system to realize that the giant ball of fire extremely close to our humble little planet is, undoubtedly, the main factor regarding temperature fluctuations. Casey might just be the only adult that still has the common sense of a child regarding this topic. Nobody is saying that atmospheric gases do not play a role in global temperatures, but should they be our point of focus. While we are worrying about a 1 or 2 degree fluctuation in temperature over 100 years due to greenhouse gases, the sun can cause greater change in much shorter periods of time. The sun is anything but a constant, and treating it as such could be one of the biggest mistakes of modern history. I applaud Casey's work, but I suspect it will not be taken seriously until politicians figure out a way to regulate and tax solar activity.

Former White House space program advisor and space shuttle engineer, John Casey hits it out of the park again with Dark Winter. In this book, he further discusses the coming Dalton Minimum (Little Ice Age) but he also details specific things we can do to best adapt to this. Of particular interest is fascinating material on the rise of volcano and earthquake activity both historically during the Maunder and Dalton minimums, but what is to come. Casey's predictions speak for themselves. Go listen to his speeches before last year's "polar vortexes" hit the USA, freezing us into miserable ice cubes. This man knows what he is talking about, and even if you decide you don't like his politics, I have read everything from Michael Mann to Bill Nye all the way far right to David Archibald, and without a doubt, Casey provides a chillingly accurate yet hopeful, read. It's a not miss if you want to know why we are heading for cooling, with serious and soon evident consequences. Don't miss this. I have Cold Sun, and I loved reading Dark Winter. I hope he tours in my area as he is a great speaker too. No, I do not know him at all, just a big fan. Beware of the inevitable trolling. Some never like the messenger, even when he's repeatedly correct.

A must read for people who believe humans are causing climate change. Really understand how climate, the Sun, and repetitive cycles work. Understand that a cycle means that it isn't possible to happen but will happen. Repeating climate change in the news everyday and in the papers doesn't make it true. It makes it propaganda. John L Casey wrote this book to say look where the evidence takes you. Look where you need to improve your production. He didn't write this book to cause fear and scare people.

As the subtitle indicates, Casey predicts a 30-year cold spell, beginning very recently. If you live in North America anywhere east of the Rocky Mountains you probably saw enough winter last year to concede that he might have a point. His calculations are based on solar cycles. A couple of years ago the publishers of the Olde Farmers Almanac stated for publication that their method of predicting weather is based on 11 and 22-year sunspot cycles, and has had essentially the same prediction method for more than 2 centuries. At that time the official weather office predictions were based on fluid mechanics. The original researchers on Chaos Theory showed conclusively that the fluid mechanics theory had an absolute maximum usefulness of 23 days. Beyond that time it is totally useless. The weather office claimed that the Farmers Almanac method was unscientific. I disagreed with that position on the basis that the two prediction methods should be judged on the accuracy of their results, not the horsepower of their computer sections. About 20 years ago the Farmers Almanac was more accurate for weather more than about a week in the future. With

advances in satellite technology this breakpoint may have been extended another few days. Casey has done his homework. He is actually a scientist, not a politician, and every page of his book shows it. He proceeds in the scientific manner. His figures show, as do most similar researchers, that there are strong weather cycles of about 100 years and about 206 years. These strongly indicate a cold period ahead, with the coldest part in about 2030. He quotes figures from other researchers. Most of these are in general agreement. I note that he quotes several Russian researchers. The Russians are not bound by political correctness so they can report results as they see them, not as some politician might see them. His figures show that the warming period that occurred in the 1990s ended in 1998. This is the same date as given by Phil Jones, the man who fudged the data used in the IPCC studies to start the whole global warming hoax. Let me be a little more specific here on the difference between politics and science. Before the first IPCC report was published I saw TV interviews of people who had worked on the project. They said that they had been asked to make their report sound more alarming. This happened repeatedly. When the report was published the data was not published, nor were the calculation procedures. The stated reason was that they might be misused by people who disagreed with the findings. This has never happened before in anything that purported to be scientific. I still remember the people who announced that they had found cold fusion. A few researchers took their procedures and repeated the experiments, with totally different results. The original authors had to admit that they had made a mistake. This became apparent because they had published their procedures and their data. By contrast the IPCC report specifically excluded both their data and their procedures. Another important exclusion was cyclic changes in solar energy output. If you or I or any other intelligent person want to find out what moves something we begin with the most important inputs and work down to the less important. Sometime after the original IPCC report someone got hold of one of the computer programs that they used to calculate weather patterns and applied it to the time since 1900. By the time it got to Y2K it was off by several degrees. The 2009 Copenhagen conference was held in the coldest weather that they had had for many years. To add to the problem WikiLeaks published a batch of emails showing that the data used in the IPCC analysis had been fudged to remove the medieval warm period because it did not fit the theory. This had been sent out by Phil Jones. A couple of years ago he admitted, in print, that the warming period had ended in 1998. He also published his data for the first time. More recently it has been shown that the figures the IPCC issued to its collaborators showed a warming in South America that was 2.5 degrees larger than it should have been. A decrease in temperature had been shown as an increase. As usual this report disappeared quite rapidly. In early June of 2015 the US government announced that their

measurements showed no global warming since 1998. Instead of accepting the results from Phil Jones and John Casey they decided to adjust their readings to match the theory. I saw an interview with Casey. In it he stated that the change in solar radiation necessary to cause an ice age is about 2.5 watts/square meter. Since the background radiation is about 1300, that is a very small change. Casey's book shows charts and figures, also the sources and a complete description of how the computations were done. Some of the diagrams end in 2008 and some in 2013 but he provides information on the sources so you can bring them up to date. I sent a question to Casey's research center asking if they had done any work to compare the solar cycle and greenhouse gas theories to explain the ice ages that occurred in ancient times.

The hypocrisy of global warming has generated millions for some and caused the rest of us to struggle to find the truth. This author has presented a good case for climate change. Much of what he has stated was published by Smithsonian in a book titled "Nature On A Rampage" in 1994. Casey gives us the missing pieces between this book on climate change and "WHY". Casey does a great job of covering a difficult subject. I would recommend this book to anyone who wants to know the truth about climate change.
